

LINKFAST Rolls out Multifunctional Wood Screws

嘉兴铭承精工 新推出多功能木螺钉

by Dean Tseng, Fastener World

One-stop Product Supply

Linkfast uses 10B21 and C1022 materials to manufacture multifunctional wood screws, timber fixing screws, and cap screws, supplying products to global industries from the headquarters in Haiyan, China. Currently it produces 1,200 tons per month which derive from a 30,000 square meters of plant with more than a hundred people specialized in relevant technology and QC. Additionally, it features a professional team making small packages for Do-It-Yourself hardware stores, as well as a well-equipped lab for QC. These strengths create a one-stop service spanning from production to Do-It-Yourself product packaging. It is highly trusted and recognized by clients for stable supply and high quality.

All-new Multifunctional Wood Screws Especially Developed for Clients

Linkfast once stuck it out for 8 months continuing to refine drawings and product samples for a client from British Commonwealth of Nations. Eventually, the company succeeded in developing the one and only product that could replace wood screws, timber fixing screws and cap screws. The product was able to boost the client's sales by one fold. "This year we developed a multifunctional wood screw that successfully passed the salt spray test up to 1,200 hours, which confirmed its higher anti-corrosion performance. The dual-slot design increases convenience in operation for users, and it can replace timber fixing screws and common square wood screws, thus featuring more advantages in design and performance than ordinary screws do," said General Manager George Yu.

The company's main target markets are Europe, N. America, Australia, and Japan. The past record of developing new screws for clients has gained Linkfast a strong foothold in the European and American high end markets for years. Therefore, Linkfast is able to supply products to the industrial, construction, home improvement and furniture industries, creating more possibilities for clients to develop their own markets and brands.

Smart Warehouse with Stable Supply

Over the years Linkfast Technical has invested a lot in lab equipment and introduced cutting machines, bending machines, embedding machines, torsion testers, coating testers, tapping

speed tests, salt spray test machines, projectors and other advanced equipment to control good quality for clients. The company has acquired CE and ISO certificates for its manufacturing process and acquired multiple patents on product applicability and visual appearance. Currently it is applying for ETA which is critical in the construction field.

Yu said, "Patents and certificates are the ticket into international market development. They are the proof of our specialty, reputation, quality and service that continue to gain clients' trust and allow us to sell products to the world. We expect ourselves not only to be a supplier for purchase but also a smart warehouse in China for clients." At a time of surging material prices and freight costs, the company continues to steadily fulfill every clients' orders.

Looking ahead, Linkfast will go deeper in Europe, USA and British Commonwealth of Nations to continue providing one-stop service for clients and make contribution to promote the growth of the global fastener industry.
